

1. Run the command `make`, this will generate a bunch of `.class` files.
2. Run the command `java -cp '.:deps' P5 typeErrors.crrt typeErrors.out`, this will report all type errors in `typeErrors.crrt`.
3. Or one can run the command `make test` to perform type checking for a correct Carrot program in the file `test.crrt`, and an unparsed version will be generated in `test.out`.
4. To clean up the mess made by `make`, run `make clean`.
